

SafeTalk Encrypted Messenger

- A new paradigm in messaging

Unlike all of the other messengers on the Planet, SafeTalk . . .

- Runs with zero permissions
- Allows you to remain totally anonymous
- Performs optional language translation
- Allows you to easily audit it's source code
- Provides fail safe continually morphing end-to-end encryption
- Can send vanishing messages with copy screen protection

**Out of Beta
March 2017**

We prove it's the safest messenger on the planet. This is not a social media toy. This is a messenger that you could bet your life on.

SafeTalk is kept completely in the dark when it comes to both you and your phone. It can't see your contacts, your videos, your pictures, your SMS messages, it doesn't know where you are, or know your browsing history, or where you go, or who you call. It doesn't even know the IEMI of your phone.

The beauty of this is that it can't tell anybody anything about you or your phone. This is all enabled through having virtually no Android [permissions](#) to look at anything on your phone.

Other messengers demand many dangerous permissions. Signal demands 27. WhatsApp demands 18. They could email all your videos to all your contacts. They could know what you look at on the internet. Signal can see all the keystrokes that you type including passwords. You have NO PRIVACY with these messengers on your phone.

How to use SafeTalk . . .

1. Make up a user name and register
2. Have your correspondent do the same
3. Share your user name with each other
4. Enter each other's username on the Settings page
5. Begin texting in total privacy

SafeTalk documentation . . .
